

1. Control Buzzer

1. Control Buzzer

- 1.1 Experiment Objective
- 1.2 Experiment Preparation
- 1.3 Experiment Procedure
- 1.4 Experiment Summary

1.1 Experiment Objective

This course focuses on learning how to control the robot's buzzer, including making it beep for 1 second before automatically turning off, keeping it on continuously, and turning it off.

1.2 Experiment Preparation

This course involves the following function from the Muto hexapod robot's Python library:

buzzer(timeout): Controls the buzzer's beeping.

The `timeout` parameter specifies the duration of the beep, with a value range of [0, 255]. If `timeout=0`, the buzzer is turned off. If `timeout=255`, the buzzer beeps continuously. Other values cause the buzzer to beep for `timeout * 100ms` before automatically turning off.

The location of the buzzer on the expansion board is shown in the figure below:

1.4 Experiment Summary

The control timeout interval for the buzzer is 100 milliseconds. After the timeout period, the buzzer automatically turns off. Within the valid control range for the buzzer, there are two special values: 0 and 255, which represent turning the buzzer off and keeping it on continuously, respectively. Any other value will cause the buzzer to beep for `timeout * 100` milliseconds before automatically turning off.
