

Control Robot Body Height

Control Robot Body Height

- 1 Experiment Objective
- 2 Experiment Preparation
- 3 Experiment Procedure
- 4 Experiment Summary

1 Experiment Objective

This course focuses on learning how to control the robot's body height function.

2 Experiment Preparation

This course involves the following function from the Muto hexapod robot's Python library:

height(level): Body height adjustment. `level=1` means low height, `level=2` means medium height, and `level=3` means the highest height.

3 Experiment Procedure

Open the JupyterLab client and navigate to the code path:

```
muto/Samples/Control/7.control_body.ipynb
```

By default, `g_ENABLE_CHINESE` is `False`. If you need to display Chinese, please set `g_ENABLE_CHINESE=True`.

```
# Chinese switch. The default value is English
g_ENABLE_CHINESE = False

Name_widgets = {
    'End': ("End", "Finish")
}
```

Click 'Run All Cells', then scroll to the bottom to see the generated controls.

Operate the different controls to manage their respective functions.

Each time you slide the Height slider, when the slider's value changes, it will immediately control the robot's body height.

```
def on_slider_height(value):  
    global g_start  
    if g_start:  
        g_bot.height(value)  
        print("height:", value)  
    else:  
        g_start = True
```

4 Experiment Summary

In this experiment, JupyterLab controls are used to manage the hexapod robot's body height function. For example, setting Height to 3 will immediately adjust the robot's body height to the maximum.

To exit the program, press the 'End' button.
